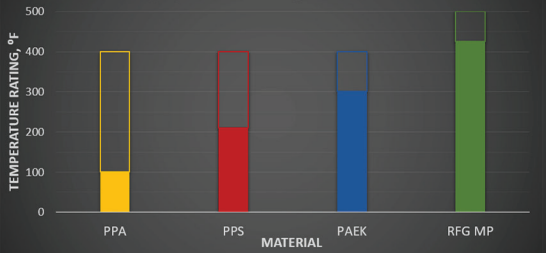
RFG PETRO SYSTEMS

QUICK FACTS

MP™ Polymer - The Best Rod Guide. Period

Temperature Rating

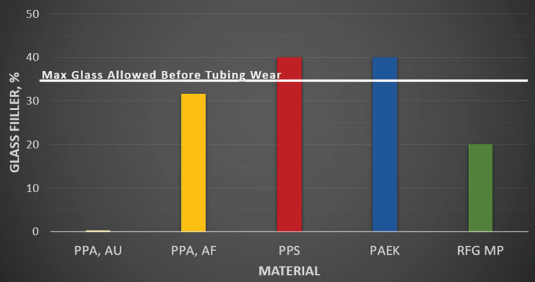
rating v. glass transition temperature of material



Glass Transition Temperature, Tg, is shown at transition of solid bar to transparent. Material degrades at temperatures > Tg

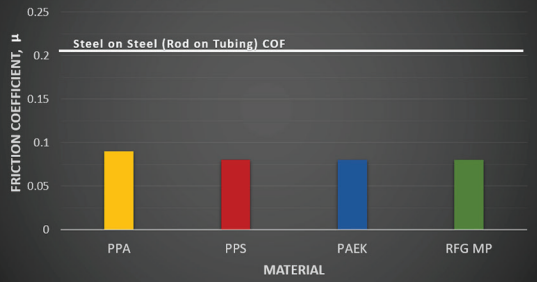
Glass Content

lower is better



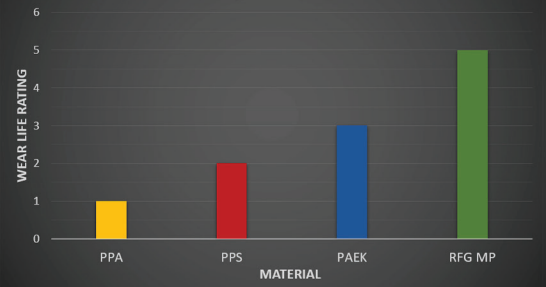
Coefficient of Friction

3rd party lab tested, Mobil 10W-30, 200° F



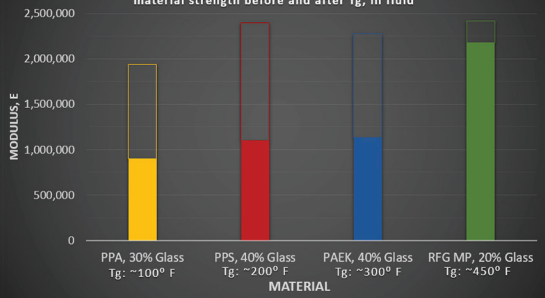
Wear Life Rating

higher is better



Property Retention Above Tg

material strength before and after Tg, in fluid



Relative Material Cost

lower is more affordable

PH: 941.487.7524

NOTE:

1. Glass Transition Temperature. Tg, reflects material integrity over the environmental temperature band. Ideally plastic would perform linear in all temperature environments
2. PPA is defined as hygroscopic, it absorbs fluid and its mechanical properties are greatly affected by submersion environments
3. Data is from 3rd party labs, or from resin suppliers, ie: Solvay
